A metal (from Greek ???????? métallon, "mine, quarry, metal") is a material that, when freshly prepared, polished, or fractured, shows a lustrous appearance, and conducts electricity and heat relatively well. Metals are typically malleable (they can be hammered into thin sheets) or ductile (can be drawn into wires).

Sheet metal cutting requires a power density of 10^6 watts/in² (source: Mike Klos @ laser mechanisms) Converting to millimeters, that's 1550 watts/mm². (using equation: $1 \text{ in}^2 = 645 \text{ mm}^2$) A 100 watt laser can achieve a power density of 1550 watts/mm² in a spot size that is 0.6452mm² A spot size that is 0.6452mm

2D transition metal carbides and/or nitride nanosheets, called MXene, are a novel class of 2D materials similar to MoS₂ and GO. (314, 636-639) Generally, MXene can be produced via the exfoliation of MAX phase powders (M transition metal; A element in groups 13 and 14; X is C and/or N). The exfoliation
